

# TRACK & TRACE: FULL TRANSPARENCY AND REAL-TIME DATA ON YOUR PRODUCTION

Today, the food and beverage industry is challenged in several areas. Most important is guaranteeing food safety. But also small margins, changes in stock and deviating orders pose a big challenge. For this, many manufacturers turn to track & trace tools. With these, they can follow their products, machines, people, ... throughout the entire factory floor which can create a lot of opportunities.

## All information instantly available

Our systems meticulously record all steps in your production and logistics processes. As a result, you have all the data you need to make the right decision at any moment. You can act quickly in case of problems and bottlenecks are immediately revealed. Moreover, thanks to the history of data you get an insight into the deeper causes and possible points of improvement.

In your logistics chain you are connected with suppliers, partners and clients. Knowing what you received from who, what happened with it and to whom it was shipped is not a luxury but a necessity and a legal obligation. Objective identifies and documents all incoming, internal and outgoing flows of goods, as well as the treatments of those goods. This way, you can summon up a complete product genealogy without effort.

## One integrated solution

With the integrated MES and WMS solution of Objective you can follow all transactions and movements from beginning to end and register them, from receipt of the goods to shipping of the finished products. The track & trace functionality in Objective gives an overview of all inventory-related logistic actions within the Objective Supervisor (who/what/where/when).

### The logistic actions can be viewed on the basis of:

- Inventory location: warehouses, locations, mobile racks, picking zone, storage zones, work zones
- Type of inventory: articles, article groups, lots, LPNs
- Performer of the actions: employees

## MES & WMS: your benefits at a glance

- Full traceability of your goods flows and uses
- Seamless connection of your logistics and production processes
- Find the cause quickly in case of recall actions
- The products are brought to the production line just-in-time (JIT) and just-in-sequence (JIS)
- Efficient movement from the end products through the warehouse to shipment
